facts

> 95 sites participating
> 174 services running
35 countries
multiple communities

Reports
A/R
Status
multiple SLA reports

results

ARGO Monitoring goal in the SeaDataCloud is to enable end users to monitor the availability and reliability of the services they are using. They want to know how the overall services they are relying upon are performing and whether the delivery of those meets the service level they have agreed. ARGO monitoring routines are configured to emulate what a user will do with a service, and to provide status and A/R reports.

Custom Status Page: VRE use case

In Virtual Research Environments (VRE), multiple types of services in several nodes cooperate as components to provide a unified dashboard with a plethora of functionalities to the end-users. ARGO not only monitors individually the proper function of these services but also combines them in logical groups and hierarchies to reflect and accurately monitor the reliability of their interoperability so as to ensure that the top-level service offer (VREs) works as expected.

ARGO components

Central Registry
A central registry to record information about the topology of SDC Infrastructure.

Metrics Management
Collect and organize metrics. It instructs monitoring instances what kind of tests to execute for a given service.

Monitoring Engine
Executes the service checks against the infrastructure and delivers the metric data to a ARGO Messaging Service

ARGO Messaging Service
A PublishSubscribe Service used by internal components and other systems to exchange messages via Topics/Subscriptions.

Connectors
A bundle of connectors/sync components for various data sources established

Compute Engine
Computes availability and reliability of services and near - real time status events

Notifications
Real-time status events are the basis of alerts. It sends alerts (e.g. email, SMS), by connecting to external sources to get info about the owner(s) of services, endpoints

ARGO is framework for Service Level Monitoring designed for medium and large sized e-Infrastructures. Research Infrastructures and Thematic Services. It Supports:

- Status, availability and reliability of services
- multiple reports using customer defined profiles
